

Team Project – Fourth Assignment

Building on the network's previous steps, we will now focus on centrality:

1. Describe the degree distribution of the network. In particular, identify the most central vertices and argue whether these vertices are significantly more central than the rest.
2. Obtain the closeness, betweenness, eigenvector and PageRank centralities and identify the most central vertices for each of them. Comment on the results.
3. Obtain the edge betweenness centrality and identify the most central edges. Comment on the results.
