

Team Project – Fifth Assignment

Building on the network's previous steps, we will now focus on cohesion:

1. Analyze the cohesion of the network using the coefficients described in the local density point in Topic 2. Try to determine based on these coefficients the local density and the connectivity of the network. Also, whether the network verifies the small-world property.
2. Run the six community detection methods seen in Topic 3 (those possible) in your network and compare results. Comment on the results obtained.
3. Obtain the assortativity coefficient of the network and obtain conclusions.
